

Subjective data collected during annual EOV monitoring

The EOV ([Ecological Outcome Verification](#)) process developed by The Savory Institute does not rely on annual soil tests. Rather than soil tests, which generally measure things which tend to change very slowly over time, Savory verifiers look at 15 different indicators of ecological health and track changes in those from year to year. The indicators look at things like evidence of microfauna (insects and such), reproductive capability (floral production, young plants), plant vigor (green leaves vs dead), abundance of desirable/rare and undesirable species (cedar, cactus, etc), dung decomposition, soil capping % of bare soil, signs of water and wind erosion.

Using these indicators, an Ecological Health Index (EHI) is calculated, and then the weighted EHI for the entire property is determined. The Cordero Fields Ecological Health Index shows that the land is regenerating under current management. Cordero Fields was awarded its EOV certificate in 2023 and has shown improvement each year since.

Ecosystem Function

Ecosystem Health is viewed through 4 functions. The health of each of these Functions relative to their potential is assessed from the Biological Indicators. Each of the functions are trending upwards at the Cordero Fields site and indicate that management has had a positive impact on Ecosystem Health.

Cordero Fields Soil Test Data

In 2021, our initial evaluation year, a Cornell Labs Comprehensive Assessment of Soil Health was performed at this site. And every 5 years, one site on the property that was selected as the long-term monitoring (LTM) site, has comprehensive soil tests performed. We chose to perform those same tests again in year three (2023) as well.

Some of the items measured and the value and rating (scale of 0 to 100 where higher scores are better) for each year are as follows:

	2021		2023	
	<u>Value</u>	<u>Rating</u>	<u>Value</u>	<u>Rating</u>
(Sandy clay loam soil)				
Predicted Water Capacity	.19	80	.22	80
Aggregate Stability	34.0	56	51.7	87
Organic Matter	3.3	61	5.3	99
Soil Respiration	0.5	42	0.7	61
Active Carbon	466	42	507	51

The Cornell Labs overall score was 63 in 2021 and increased to a score of 68 in 2023.
